

One recorded trace. One process question. A result you can inspect and rerun.

2 to 4 weeks

Recorded files only

No production connection

The offer: provide one small robotics, simulation, or workcell trace and one narrow process question. Metriplane will build or assess a deterministic adapter, preserve the field-level provenance, run the bounded evaluation, and return either a reproducible result or a clear reason the source is not supportable.

What you provide

- **One bounded trace** that is public, synthetic, historical, or otherwise approved.
- **Field meanings** for time, units, coordinates, stable identities, and missing data.
- **One process question**, such as a missed handoff, delayed arrival, or missing required asset.
- **One technical reviewer** who can inspect the mapping and final result.

What you get

- A source-fit decision and a source-specific adapter when the data is suitable.
- A provenance manifest, entity mapping, normalization report, and portable fixture.
- A human-readable result with exact software, source, rule, and limitation identities.
- Evidence-bundle verification and a generated regression when an incident exists.
- Reproduction instructions and a reviewer-ready technical summary.

How it runs

- 1 **Fit check:** Rights, fields, clock, coordinates, identities, completeness, and scope.
- 2 **Adapter and fixture:** Named transforms, projection, mapping, and information loss.
- 3 **Evaluation:** Validate, run, verify evidence, and execute any generated regression.
- 4 **Review:** The nominated reviewer checks the mapping, result, and limits.

Good fit

- Recorded object or robot state with stable identities.
- A narrow timing, ordering, required-asset, or zone condition.
- A small sample that can be understood without production access.
- A reviewer who values an honest negative result as much as a positive one.

Outcome

SUPPORTED

All required gates pass for the exact recorded source and scope.

PARTIALLY SUPPORTED

Useful output exists, with a named limitation that prevents full acceptance.

NOT SUPPORTED

A rights, semantics, scope, or technical blocker prevents a defensible evaluation.

Not included

- Live robot or machinery control.
- Safety, quality, certification, or production approval.
- Arbitrary video understanding or unrestricted anomaly detection.
- A guaranteed incident, testimonial, public name use, or endorsement.
- A broad compatibility claim for the source family.

Start with a sample schema or a 30 to 60 second trace.

No production connection is required. Public or synthetic data is preferred when it can answer the same question.
